CERIF tutorial
A name or title

A short or long description (abstract)

A code (identifier), for ex a Grant number

A web page (URI)

A (planned) start date

A (planned) end date or duration

[A project coordinator]

[A source of funding]

[A research domain]

A few keywords
The PROJECT entity has properties (attributes) and is linked to other entities.

The multilingual attributes are represented by a linked entity each.

* “start date” and “end date” are deprecated in v1.6
CERIF naming rule: in English, abbreviated, starting with cf
Example: Project title = cfProjTitle
Representation in Database

Format, Unicity, Not-null, Foreign Key (FK), composed Primary Key (set of PFK and PK)

Representation in XML

Enclosing XML element = CERIF entity physical name (cfProj)
Enclosed XML elements = CERIF entity’s attributes (cfProjId, cfAcro,...)

XML attributes are used for multilingual CERIF attributes

cfLang, cfTrans:
• o for original language
• h for human translation
• m for machine translation

- OrganisationUnit
Project definition

A temporary endeavor undertaken to create a unique product, service or result.
Source: the Project Management Institute, https://www.pmi.org/about/learn-about-pmi/what-is-project-management

In the research information domain, one typically tracks:
(1) research projects, where the result is an addition to the body of knowledge of the mankind,
(2) technology development projects, where the result is a particular technology or product,
(3) innovation projects, where the result is an improvement of a product or process, and
(4) projects that create or enhance infrastructure for research, technology development or innovation.

Depending on the scope one can also track finer levels of granularity: stages, work packages, sometimes even down to individual tasks. All such activities are also modelled using the Project entity and linked using the recursive link relationship.

The Project entity only captures details of the project scope and plan. Information about the resources needed to execute the project such as the funding (i.e., the grants received), the people and organisations involved, the supporting infrastructures, the outputs produced, etc. is contained in separate entities (the Funding entity, the Person entity, the OrgUnit entity, the infrastructure entities, the result entities respectively) and is linked to the Project.
OrgUnit definition

Organisation Unit: an organisation, a unit therein, a committee or any other group of people that has a collective goal. Organisation Units are not necessarily formalized as legal entities.

In the research information domain Organisation Units typically represents:
(1) organisations that **perform research** (universities, research institutes, corporations) and their subdivisions (faculties, schools, departments, research groups) and other associated bodies (boards, advisory bodies);
(2) organisations that **fund research** (funders, their divisions and evaluation panels);
(3) scientific **associations and networks**;
(4) **publishers**, facility **operators** and other **service providers** in the research space;
(5) **authorities**, such as patent offices and standardization or supervision bodies; and
(6) other bodies: editorial **boards**, evaluation **panels**, or **committees** of all kinds.
Person definition

A human being as an individual.
Source: https://en.oxforddictionaries.com/definition/person

The kind of involvement of a Person in the research ecosystem is specified in the links with the organisations, the services, etc. This typically includes:
(1) researchers (Persons performing research in an Organisation Unit as employees or students);
(2) authors and contributors (Persons signing a publication, creators of data sets, software developers, etc.);
(3) investigators and project participants (Persons involved in a Project as principal investigators, co investigators, project managers, consultants, etc.);
(4) management (directors, rectors, deans, department heads, etc.);
(5) support staffs (technicians, responsible for Equipment, librarians and digital asset curators, administrative staff, etc.).
One Person typically has many of these relationships.
INTERMEDIATE SUMMARY

• CERIF is:
  – A conceptual model
  – A storage format in relational database
  – A set of exchange formats (XML, Linked Data)

• CERIF supports multilingual data, storing the original value of a literal attribute, and for any other language, a value translated by a machine and/or a human

• So far, we have seen the CERIF Entity “PROJECT” (cfProj)
We have seen how to represent, store or exchange metadata about research projects.

Similarly:

• What characterises a person (researcher, Ph.D.,...)?

• What characterises an organisation (research laboratory, institute,...)?

A typical CERIF entity has:

- Identifier (internal)
- Attributes
  - the basic ones
  - the multi-lingual ones
- External Identifiers
- Classifications
  - Type
  - Status
  - Subject area
  - + other
- Links
  - to other entities
  - recursive, a.k.a. self-referential
Some CERIF Link Entities

- Person_ResultPublication: role=author
- Project_ResultPublication: role=deliverable
- Person_OrganisationUnit: role=research assistant
- Person_Project: role=principal investigator
- OrganisationUnit_ResultPublication: role=author’s affiliation
- Project_OrganisationUnit: role=coordinator

The International Organisation for Research Information

euroCRIS
Current Research Information Systems
CERIF Semantic Layer

Central place to store declared semantic classifications

Allows to capture any Schema or Structure
- Flat Lists
- Thesauri
- Classification Systems (e.g. SKOS, ...)
- Taxonomies
- Ontologies

Open / Extensible in all directions
- New Schemas
- New Concepts / Terms
- New Relationships

Enables to manage
- Roles, Types, Statuses, ... Semantics
- Subject Headings
- Versioning and archiving (start+end dates)

Allows for Mappings between Schemes
- skos:closeMatch, skos:exactMatch or any other mapping you need
CERIF highlights

• Right level of abstraction
• Normalized model
  – Record information only once
  – Reference rather than copy
• Versatile Semantic Layer
• Time-based relationships
• Clean design, regular structure
Metadata Layers

- **Discovery metadata**
  - DC, VIVO, MODS, METS, eGMS, DCAT, ...

- **Contextual metadata**
  - CERIF

- **Detailed metadata**
  - Domain-specific standards

CERIF is an EU Recommendation to Member States

The European Commission (EC) has authorised euroCRIS to maintain and develop CERIF and its usage

http://cordis.europa.eu/cerif/
Interoperability

1. Agreed Semantics
2. Agreed Format
3. Agreed Protocol
CERIF-XML exchange formats  
(based on XML Schema)

Original
1:1 with the ER structure
Only uses embedding for multilingual texts
→ Many foreign key relationships
→ Takes several API requests to get a presentable form of an object

2nd Generation
Template XML Schema → adaptation
Profiles: Useful subsets of CERIF for specific research information exchange scenarios
1. Specify a subset of CERIF entities & attributes
2. Fix semantic vocabularies to use
3. Add integrity constraints

Ex.: OpenAIRE Guidelines for CRIS Managers 1.0.
DOI 10.5281/zenodo.17065

Ex.: OpenAIRE Guidelines for CRIS Managers 1.1.
DOI 10.5281/zenodo.1298649

Phenotypically cryptic lineages comprise an important yet understudied part of biodiversity;
CERIF Profiles in general

Useful subsets of CERIF for specific research information interchange scenarios

• Entities & attributes:
  – Profile ⊂ CERIF

• Semantic vocabularies:
  – Profile – specific choices
  – Sources: CERIF & beyond

• Integrity constraints:
  – Profile ⊃ CERIF
CERIF Profiles in general

Producers know what to include

Consumers know what to expect
CERIF Refactoring

• Address shortcomings of current CERIF
• Modernize CERIF
  – Take away the perceived complexity of CERIF
  – Involve the community in further development of CERIF
  – New modelling approach (and tool), modularity, modern serialization formats
• Ongoing project started 2021

☞ CRIS 2022: more to be presented on Friday at 16:30 ☞
