

Title	Implementing a web-based Research Information System as a tool for Knowledge management and Performance Monitoring
Author keywords	current research information systems research information management research reporting research performance Open Access publications projects
Abstract	Institut Pasteur de Tunis (IPT) has initiated the set-up of a web-based Research Information Management system that aims to serve as an insight tool and to provide easy access to research information related to publications, awarded projects and relevant funding programs. Dynamic data presentation features are expected to enable easier exploitation of projects and bibliometric data to have meaningful information. An online dashboard will integrate up-to-date indicators with different reading scales to facilitate reporting and research performance monitoring. The system takes into account Open access requirements in a manner to promote more efficient knowledge access, research result valorisation, and dissemination, as well as a participative approach for an active adherence of the different stakeholders.
